

India Human Voice Agent Prospects

Power BI Dashboard Documentation & Business Analysis Report

Objective: transform a 203-company prospect database into a decision-oriented view of data completeness, contactability, industry distribution and outreach readiness.

Metric	Final result
Total companies	203
Email coverage	83.7%
Phone coverage	39.4%
Website coverage	95.1%
Overall completeness	77.0%
High-priority prospects	75 (36.95%)

This report documents the data preparation, calculated business logic, dashboard visuals, key findings and recommended actions.

1. Project Overview

The project focused on building a usable prospect intelligence dataset for companies relevant to human voice-agent outreach in India. The final Power BI solution goes beyond listing companies: it measures data quality, identifies contactability gaps, segments the prospect base by industry and prioritizes prospects for outreach.

2. Data Preparation & Cleaning

- **Standardized fields:** company, industry, leadership, CEO email, current/business email, phone and website were normalized.
- **Missing values:** blank cells and placeholder values such as Not Found, N/A, None and Contact form only were treated as missing.
- **Industry standardization:** raw industry descriptions were mapped to consistent Industry_Main business categories for reliable grouping.
- **Email validation:** email strings were cleaned, valid email patterns extracted, and availability/validation flags created.
- **Phone validation:** phone values were normalized and checked using a stricter Indian mobile-number rule, producing a usable Phone_Available flag.
- **Website validation:** URLs were normalized and checked for a basic valid website pattern.
- **Analytical fields:** missing flags, data-gap counts, completeness score, quality category, outreach score, priority and contactability status were derived for Power BI.

3. Completeness & Quality Logic

Each company receives a weighted data-completeness score out of 100: Email 30 points, Phone 20, Leadership 20, Website 20 and Industry 10. Quality is classified as High (80–100), Medium (50–79) or Low (below 50).

Field	Weight
Email	30
Phone	20
Leadership	20
Website	20
Industry	10
Maximum	100

Overall Completeness is a row-level average of the availability of Email, Phone, Website and Leadership. An available field contributes 1; a missing field contributes 0; the four-field average is then calculated across the dataset. The final dashboard displays 77.0%.

4. Outreach Logic

The outreach score weights Email at 40 points, Phone at 25, Leadership at 20 and Website at 15. Scores of 80+ are High Priority, 50–79 Medium Priority and below 50 Low Priority. Contactability is split into Email + Phone, Email Only, Phone Only and No Direct Contact.

5. Dashboard Walkthrough

5.1 Total Companies

203 companies are included in the final prospect universe. This is the denominator used to interpret coverage and priority metrics.

Business use: establishes the size of the outreach universe.

5.2 Email Coverage %

83.7% of companies have a usable email through a valid current/business or leadership email.

Business use: indicates the scale of email-based outreach that can begin immediately.

5.3 Phone Coverage %

39.4% have a valid phone number under the stricter phone-cleaning rule.

Business use: identifies phone enrichment as the largest contactability weakness.

5.4 Website Coverage %

95.1% have a usable website.

Business use: most prospects can be researched or verified online.

5.5 Overall Completeness %

77.0% is the average completeness across Email, Phone, Website and Leadership.

Business use: gives management one headline indicator of database completeness.

5.6 Missing Email / Website / Phone

The cards show 33 missing emails, 10 missing websites and 123 missing phone numbers.

Business use: translates coverage percentages into concrete enrichment workloads.

5.7 Companies by Industry

Technology is the largest category at 31 companies, followed by Financial Services and Healthcare at 29 each and Education at 26.

Business use: identifies where the prospect base is concentrated.

5.8 Email Coverage by Industry

Coverage varies materially by industry. Marketing is lowest at 40.0%; Technology is 71.0%, while several categories reach 100%.

Business use: identifies industry lists requiring targeted email enrichment.

5.9 Outreach Priority

The donut shows 99 Medium Priority (48.77%), 75 High Priority (36.95%) and 29 Low Priority (14.29%).

Business use: defines the immediate outreach pool.

5.10 Industry × Outreach Priority

The stacked chart combines industry volume with High, Medium and Low priority, showing where the strongest outreach opportunities are concentrated.

Business use: supports campaign sequencing and resource allocation.

6. Key Business Insights

- **Phone is the primary enrichment gap:** 123 companies lack a validated phone number, while phone coverage is only 39.4%.
- **Email is relatively strong:** 83.7% coverage leaves 33 companies requiring email enrichment.
- **Website coverage is excellent:** 95.1% of the prospect universe has a usable website, supporting verification and research.
- **Industry concentration is clear:** Technology, Financial Services, Healthcare, Education and Automotive & Mobility form the largest groups.
- **Marketing needs attention:** email coverage is only 40%, making it the clearest industry-level email enrichment priority.
- **Outreach is actionable:** 75 companies are High Priority and 99 are Medium Priority, so most of the database falls into actionable tiers.
- **Data quality and sales readiness are separated:** completeness measures how much information exists, while outreach priority measures how usable the record is for contacting a prospect.

7. Recommended Actions

- **1. Enrich phone numbers first.** Prioritize the 123 missing/invalid phone records, particularly for prospects intended for voice-agent outreach.
- **2. Enrich the 33 missing-email records.** Where possible, prioritize decision-maker or leadership contacts over generic inboxes.
- **3. Start outreach with the 75 High Priority companies.** Use the Industry_Main segmentation to tailor campaigns.
- **4. Work the 99 Medium Priority records.** Enrich missing fields to move suitable prospects into the High Priority pool.
- **5. Maintain the cleaned structure.** Continue using standardized fields and derived validation flags so future data additions remain Power BI-ready.

8. Dashboard Interactivity & Design

The dashboard uses slicers such as Industry_Main and Email_Available so the KPI cards and charts can respond to selected segments. The layout intentionally separates headline KPIs, industry analysis, data-quality indicators and outreach priority. This turns the report from a static database summary into an interactive management tool.

9. Final Conclusion

The completed solution converts the prospect dataset into a business-focused intelligence dashboard. It shows that the database has strong website and email coverage but a substantial phone-data gap. It also identifies 75 High Priority prospects and provides industry-level visibility for targeted outreach. The dashboard therefore supports two connected decisions: what data should be enriched first and which prospects should be contacted first.
